

Breathing pipe height is minimum distance above finished roof level.

FRIENDS OF COLLIER'S WOOD

Fun with Learning Species Box scheme
FwL - SB - H1

Tunnel is unattached to allow for gradient in access. This is particularly important for buried boxes. Ideally all box is below ground level. End of tunnel slots into prepared hole in box.

NOTES:

- 1) Plan dimension of box can change to suit timber available. 750cm² floor area is the minimum.
- 2) Extend tunnel length to suit the situation.
- 3) Tunnel gradient can be steep if drainage is good.
- 4) Top of buried box should be 10cm below the surface of ground.
- 5) Box dimensions are in mm.

Box has a floor, tunnel does not.
All dimensions are internal and do not allow for thickness of timber.
Box should be 'buried' within a log pile, stone heap, or, in well drained ground.
